FARM EMPLOYMENT ON MAY 1 SLIGHTLY ABOVE YEAR EARLIER

A total of 10,366,000 persons were working on farms in the United States on May 1, an increase of 350,000 or about 3 percent over the number working a year earlier, the Bureau of Agricultural Economics reported today. The increase was attributed partly to better weather conditions during the last week of April than in that week in 1945, which was generally wet and cold.

Responding to extremely favorable weather, farm work was more advanced than usual on May 1. Rains interfered little with field work around May 1, except in parts of Arkansas and the neighboring areas of Oklahoma, Texas, and Louisiana. Spring small grains were mostly seeded, corn was being planted in the Corn Belt States, and much of the Nation's cotton acreage had been planted.

There were 8,791,000 farm operators and unpaid members of their families at work on farms May 1 compared to 8,153,000 a year ago, an increase of 3 percent. All regions except the Pacific States showed some increase over a year earlier, and the decline there was small.

The number of hired workers on May 1 totaled 1,975,000, 6 percent larger than a year earlier, only the South Atlantic States having fewer hired hands than on May 1, 1945. The sharpest increases were 20 percent in the West North Central States, and 14 percent in the Pacific States.

The seasonal increase from April 1 to May 1 of 1,250,000 persons working on farms was about 250,000 greater than in this period of the two previous years and also greater than the average increase in 1935-39. The rise was greater than usual for both family and hired workers, with the advance in number of hired workers the larger of the two. The number of family workers showed about the usual seasonal increase in the North Central and South Atlantic Regions but a greater than usual rise in all other regions, except the Pacific Coast States where the April 1 to May 1 advance was less than in 1935-39. Seasonal increases in the number of hired farm hands were less than the 1935-39 seasonal average in all the southern regions and in the Mountain States. In all other regions advances in the number of hired workers employed were sharply higher than in the pre-war period. The largest increase was 39 percent in the West North Central States, more than twice as large as the 1935-39 average advance during April.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

Farm operations in the New England States were well advanced. Oats and hardy vegetables were mostly planted and land was generally worked for planting of later crops. There were 247,000 workers engaged in farm work in New England, 20,000 more than a month ago and 12,000 more than a year earlier. Family workers made up over two-thirds of the total, but the increases in number of hired workers from both a month earlier and a year earlier were twice as large as for family workers.

The number of workers employed on farms in the Middle Atlantic States increased 4 percent from a year earlier, with increases of 2 percent in the number of family workers and of 9 percent in the number of hired workers. Most of the seasonal increase in number of persons employed on farms came from an increase in the number of hired workers, -- an increase of 23 percent compared to a 3 percent increase in the number of family workers. Spring grains were nearly all planted in the Middle Atlantic region, with some early planted oats up. Asparagus harvest in New Jersey was under way but proceeding slowly due to cool weather. Plantings of snap and lima beans were also current tasks.

In the East North Central States there were 2 percent more workers on farms on May 1 than a year earlier. Good progress was being made with spring work. Most of the oats acreage was planted and corn planting was generally under way. Dry soil conditions were hampering work slightly in Ohio. Sugar beets and potatoes were about all in the ground in Michigan. The number of family workers was 1 percent greater than a year earlier, having increased 3 percent since April 1. The number of hired workers showed an increase of 5 percent over a year ago and a much larger seasonal increase (22 percent).

On May 1 there were 239,000 hired persons at work on farms in the West North Central States, 20 percent more than a year ago and 39 percent more than a month earlier. Comments from individual States indicated that farmers were generally finding supplies of labor adequate at prevailing wage rates. Family workers on May 1 totaled about the same as a year ago, but 4 percent more than on April 1. Spring work was well advanced in comparisons with a year ago when field work was hindered by wet cold weather in late April. Spring small grain planting was nearly completed, half the corn and cotton were planted in Missouri, and much corn ground was ready for planting farther north. In Iowa many farmers had finished working land for corn but were delaying planting until after May 1. Flax seeding was mostly finished in South Dakota and getting under way in North Dakota. In eastern Kansas alfalfa hay was being cut.

With corn and cotton planting and tobacco setting in full swing and some cotton chopping started in the southern part of the region, the number of persons employed on farms in the South Atlantic States on May 1 was 15 percent larger than a month earlier and only slightly exceeded the number employed a year earlier. Employment of family workers was 16 percent above a month earlier and 2 percent greater than on May 1 a year ago. The number of hired workers, however, was 4 percent less than a year earlier despite an 11 percent increase during the past month.

In the East South Central States the number of persons working on farms on May 1 was 23 percent larger than a month earlier and 7 percent larger than a year earlier. These were the largest increases recorded for any

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

geographic division. Both family and hired workers increased in numbers during both periods, but the number of family workers showed the greater absolute and percentage increases. Weather was not a limiting factor in the use of farm labor. Corn and cotton planting and tobacco setting were the major jobs in the region. In Alabama, harvest of early commercial potatoes was in progress. Bahamian workers were being used to supplement local labor during the peak load. Strawberry picking in Alabama was about complete with most picking being done by women and children.

Rain caused some delay in field work in parts of the West South Central States. However, despite interference with field work the number of persons employed increased 20 percent during April to reach a total on May 1, four percent higher than a year earlier. The seasonal increase from April 1 amounted to 21 percent for family workers and 15 percent for hired hands. The number of family workers was 4 percent greater than a year ago while the number of hired workers was 2 percent greater. Cotton planting was almost completed in the more southern parts of the region and well under way in the remainder. In Texas corn was nearly all planted and planting of sorghums started except in the High Plains area, where soils were dry and the normal planting date is after May 1. Onion, tomato, and potato harvest were also active in Texas. In Arkansas strawberry harvest was in full swing and first cuttings of alfalfa and lespedeza hay were being made.

Favorable weather in the Mountain States permitted steady field work around May 1. Spring grains were in process of being planted, with a considerable portion of the job completed. Land preparations were underway for later crops. In some areas sugar beets were up and were being thinned. Although weather conditions permitted spreading the work over considerable time, the number of persons working on farms was 6 percent greater than a year earlier. Employment of both family and hired workers was moderately higher. The number of all persons working on farms was 10 percent higher than on April 1, with family workers up 8 percent and hired workers 15 percent.

Farm work in the Pacific Coast States was proceeding with favorable weather. The number of hired workers was 14 percent larger than a year ago and 28 percent higher than on April 1. Family workers increased very slightly in numbers during April and on May 1 were slightly less than a year ago.

Seeding spring grains was the major job in Oregon and Washington about May 1. In Washington beet thinning and asparagus cutting were also of importance. In California field work included planting rice, cotton and alfalfa, working sugar beet fields, and cutting and baling alfalfa hay. Harvest of truck crops (lettuce, peas, asparagus, carrots, spinach and early potatoes) also engaged large numbers of farm workers. Citrus harvest was another job of importance.

^{1/} Revised.

^{2/} Preliminary.

The basic data used for the period 1910-36 were compiled and published by the Works Progress Administration in the National Research Project Report No. A-8, November 1938. The data have been brought up to date by the U. S. Dept. of Agriculture and are shown in the accompanying table. Size of farm enterprise based on estimated crop acres and livestock numbers and 1925-29 labor requirements per unit.
